GEOSITE INTEL

601 Fairview Avenue Property Intelligence Report

Washington Park, Beaufort County, North Carolina
Environmental, terrain, drainage, soils, and usable-area screening

Desktop screening indicates that mapped environmental and drainage constraints are concentrated along the parcel's west and northwest side. The planning scenario retains one contiguous 0.416-acre candidate area across the central and southeastern portion of the parcel.

Prepared September 2026 | Screening-level decision support

Executive Summary

0.548 ac Subject parcel	0.061 ac Mapped NWI overlap	0.416 ac Planning candidate area	0.272 ac Higher-ground candidate

KEY FINDINGS

- No mapped FEMA flood-hazard polygon overlaps the subject parcel.
- A mapped NWI R5UBH feature overlaps 0.061 acre, or 11.2% of the parcel.
- The lowest parcel-edge cell, mapped NWI feature, and DEM-derived flow paths agree along the west/northwest side.
- The planning scenario leaves one contiguous 0.416-acre candidate area, representing 75.8% of the parcel.
- SSURGO rates septic absorption fields as very limited. Site-specific wastewater review remains necessary.

Decision context: The central and southeastern portion of the parcel remains the strongest candidate for closer site-fit review. This is not yet a buildable-area conclusion because the zoning district and setbacks, wastewater pathway, surveyed easements, and field status of the R5UBH corridor remain unresolved.

Map colors: green = area outside the stated planning-screen constraints; salmon = combined planning-screen constraint footprint; blue = DEM-derived concentrated-flow corridor; red = subject parcel.

ENVIRONMENTAL CONTEXT

Flood and Wetland Screening

FEMA FLOOD SCREENING

No mapped FEMA flood-hazard polygon overlap was identified on the subject parcel. This does not eliminate localized drainage, ponding, or finished-floor concerns.

NWI SCREENING

The mapped R5UBH feature overlaps approximately 0.061 acre, or 11.2% of the parcel, along the west/northwest side. NWI mapping is a screening source and does not establish jurisdictional wetland boundaries.

Verification priority: field-review the mapped R5UBH corridor and obtain any jurisdictional determination required for a proposed project before relying on the remaining area for design or permitting.

Terrain and Modeled Drainage

1.01-6.20 ft Elevation range	4.52 ft Parcel median	1.90% Median slope	West edge Lowest parcel-edge cell

The parcel is generally low-relief, with 53.3% of mapped cells in the 0-2% slope class and 35.1% in the >2-5% class. The lowest parcel-edge cell is approximately 1.11 ft along the west side. DEM-derived concentrated-flow paths and the mapped R5UBH corridor occupy the same general west/northwest band, strengthening the desktop drainage signal.

Modeled D8 flow represents surface routing implied by the DEM. It does not include pipes, culverts, curb flow, site grading, or surveyed spot elevations.

Usable-Area Scenario Comparison

NWI-only screening

Candidate: 0.487 ac (88.8%) | Constraint: 0.061 ac
NWI buffer: 0 ft | Flow: Not included

Planning screen

Candidate: 0.416 ac (75.8%) | Constraint: 0.133 ac
NWI buffer: 15 ft | Flow: 0.25-ac threshold / 10-ft corridor

Conservative screen

Candidate: 0.380 ac (69.2%) | Constraint: 0.169 ac
NWI buffer: 25 ft | Flow: 0.10-ac threshold / 15-ft corridor

50-ft sensitivity screen

Candidate: 0.298 ac (54.3%) | Constraint: 0.251 ac
NWI buffer: 50 ft | Flow: 0.10-ac threshold / 25-ft corridor

Scenario distances are analytical sensitivity assumptions—not zoning setbacks, wetland buffers, or regulatory determinations. The Planning screen is the working comparison scenario; all four remain editable in the QGIS layout.

ADDITIONAL FEASIBILITY QUESTIONS

Soils, Access, and Planning Status

SOIL SCREENING

Map unit: Sb - Seabrook loamy sand
Hydrologic soil group: A
Dominant drainage: Moderately well drained
Dwelling without basement: Somewhat limited
Dwelling with basement: Very limited
Septic absorption field: Very limited

ACCESS AND PLANNING

Nearest mapped street: approximately 25.3 ft

Zoning district: Pending written confirmation from the Town of Washington Park. City of Washington zoning and future-land-use maps were not used to assign a district because they are not authoritative for Washington Park.

SSURGO ratings are screening flags. A site-specific septic evaluation, survey, geotechnical review, and written planning determination control project feasibility.

Conclusions and Due-Diligence Priorities

WHAT THE DESKTOP EVIDENCE SUPPORTS

- The strongest environmental and drainage signal occurs along the west/northwest parcel edge.
- The planning scenario retains one contiguous 0.416-acre candidate area across the central and southeastern parcel.
- Approximately 0.272 acre of that candidate area is at or above the parcel's smoothed median elevation.
- No mapped FEMA flood-hazard polygon overlaps the parcel.
- Soil and wastewater limitations may be more consequential than mapped flood exposure.

WHAT THIS SCREENING DOES NOT PROVE

- A legally buildable envelope
- A jurisdictional wetland boundary
- Septic suitability or public sewer availability
- Surveyed access, easements, rights-of-way, or drainage infrastructure
- Finished-floor, grading, stormwater, or foundation feasibility
- Compliance with unconfirmed zoning setbacks

RECOMMENDED NEXT CHECKS

1. Obtain written zoning-district confirmation from the Town of Washington Park.
2. Confirm applicable front, side, rear, water-feature, and accessory-structure setbacks.
3. Confirm public sewer availability or obtain an on-site wastewater evaluation.
4. Review a current survey for parcel boundaries, easements, rights-of-way, and drainage features.
5. Field-review the R5UBH corridor and obtain any required jurisdictional determination.
6. If redevelopment is proposed, evaluate finished-floor elevation, grading, drainage, and stormwater needs.

METHOD AND LIMITS

This report combines mapped parcel, FEMA, NWI, DEM, SSURGO, streets, aerial imagery, and derived terrain/flow information for screening-level decision support. Raster coordinates were standardized to EPSG:6543. No vertical-datum conversion was performed. DEM-derived flow is sensitive to resolution, smoothing, boundary conditions, structures, and unmapped infrastructure.
